

INDUSTRIAL TRAINING PRESENTATION

DATA ANALYST 45 DAYS INTERNSHIP AT ELEVATE LABS

Name : Gaurav Singh Shekhawat

Registration No. : 229302573

**MANIPAL
UNIVERSITY JAIPUR**

University under Section 2(f) of the UGC Act

Internship Overview

Process is Key

Learned the systematic process: from data cleaning (the most critical step) to modeling and final visualization.

Contextual Insights

The real value is in asking the right questions and translating data into a story (e.g., "Why do registered riders behave differently?").

Tool Integration

Mastered the synergy between tools: using SQL to extract, Excel to clean, and Power BI to visualize and share.

Week 1: Foundations in Excel (Bike Sales Analysis)

Objective: To take a raw, messy dataset and perform the entire analysis workflow within Excel.

Process:

Data Cleaning: Identified and removed duplicate rows. Corrected inconsistencies in string values (e.g., standardizing 'M' to 'Married').

Data Transformation: Created a new 'Age Bracket' column using IF statements to segment customers.

Analysis & Visualization: Built a dynamic dashboard using Pivot Tables and Slicers to analyze sales by key demographics.

Key Insight: The 'Middle Age' demographic (40-60) was the most valuable customer segment, and '0-1 Miles' was the largest 'Commute Distance' segment, indicating a local customer base.

Week 2: Advanced Excel (Customer Demographics)

Objective: To master data segmentation and analysis using advanced Pivot Table techniques.

Process: Analyzed a new dataset focused on customer profiles.

- Created multiple, interconnected Pivot Charts to break down the customer base by 'Job Industry', 'State', and 'Wealth Segment'.

Key Insight: Discovered that 'Manufacturing' and 'Financial Services' were the top job industries, and 'Mass Customer' was the largest wealth segment, providing clear targets for marketing.

Week 3: Excel Dashboarding (Store Annual Report)

Objective: To aggregate a full year of sales data into a single, cohesive, and interactive executive dashboard in Excel.

Key Insight: The dashboard clearly showed that 'Maharashtra' was the top-performing state (2.99M), 'Amazon' was the dominant sales channel (35%), and the store maintained a high 92% delivery rate.

Process:

- Consolidated and cleaned 12 months of sales data.
- Built a final dashboard with 6 key visualizations (e.g., 'Total Sales vs. Orders', 'Sales by State', 'Order Status').
- Used Slicers for 'Month', 'Channel', and 'Category' to make the entire report fully interactive.

Week 4: Introduction to Power BI (Spotify Top Tracks)

Objective: To transition from Excel to Power BI and learn the fundamentals of data modeling and visualization in a new tool.

Key Insight: The Weeknd's 'Blinking Lights' was the most-streamed track at 4 billion, showcasing the platform's ability to handle large-scale data.

Process:

- Imported the Spotify dataset into Power BI and used the Power Query Editor for data transformation.
- Wrote basic DAX (Data Analysis Expressions) measures to create new metrics
- Designed a dark-mode dashboard with KPIs, tree maps, and slicers to analyze top artists, tracks, and audio features.

Week 5: Advanced Power BI (Adani Stock Analysis)

Objective: To apply Power BI to a more complex time-series dataset.

Key Insight: The 'Monthly Totals' chart visualized a clear correlation between high trading volume and periods of significant price volatility, a key indicator for investors.

Process:

- Analyzed historical daily stock data.
- Created time-series line charts to visualize trends in 'Open', 'Close', and 'Volume'.
- Developed KPIs for '52-Week High', 'Total Volume', and 'Average Close Price'.

Week 6: Project Phase (Bike Shop Analysis)

Objective: To execute an end-to-end data analysis project, integrating all skills learned (SQL, Excel, and Power BI).

Key Insight: The dashboard revealed that 81% of riders are 'registered' (a loyal customer base), 'Summer' (Season 3) is the most profitable season (\$4.9M), and peak earning hours are 8 AM and 5-6 PM, aligning with work commutes.

Process:

- **SQL:** Wrote queries to extract and join data from multiple tables in a relational database.
- **Excel:** Used Excel for initial data validation and cleaning of the extracted data.
- **Power BI:** Imported the cleaned data, built a relational data model, and created a comprehensive dashboard to analyze business performance.

Week 6: Project Glimpse

Thank You
